

UAS FOR CALIFORNIA WATER RESOURCES SUMMIT

What instruments do we need on UAS to measure crop water status?

Susan Ustin, UCD and Joaquim Bellvert, IMTA, Spain

Why is agriculture interested in Remote Sensing?

Manage within-field Spatial Variability

- Precision Irrigation 
 - Improve irrigation efficiency
 - Determine crop water requirements
 - Identify crop water status
- Precise Fertilization
- Precise Pest Management
- Yield forecasting

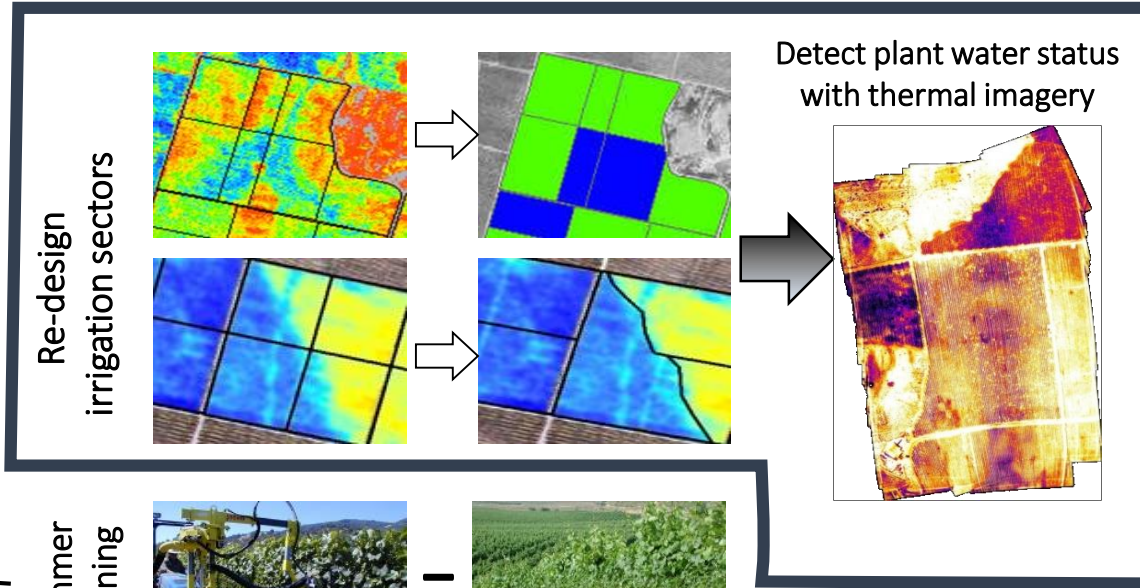

Identify spatial variability

Selective Harvest

Actions to reduce spatial variability

Compost+deep plowing

UAS FOR CALIFORNIA WATER RESOURCES SUMMIT

How do we measure usually crop water use and status?

Traditional Approach: Pressure Chamber measures Leaf Water Potential

- Measures energy required to pull water from soil to leaves
- Widely used by growers to estimate water deficit

Login | Register

241 Stations
On ave. about
150 are
operating at
one time

- Hourly and Daily Data for Potential (reference) Evapotranspiration (ET_0) based on weather conditions -- - not actual crop water use
- Long record of weather conditions at these sites
- Crop coefficients are used to adjust ET_0 to estimate of actual ET

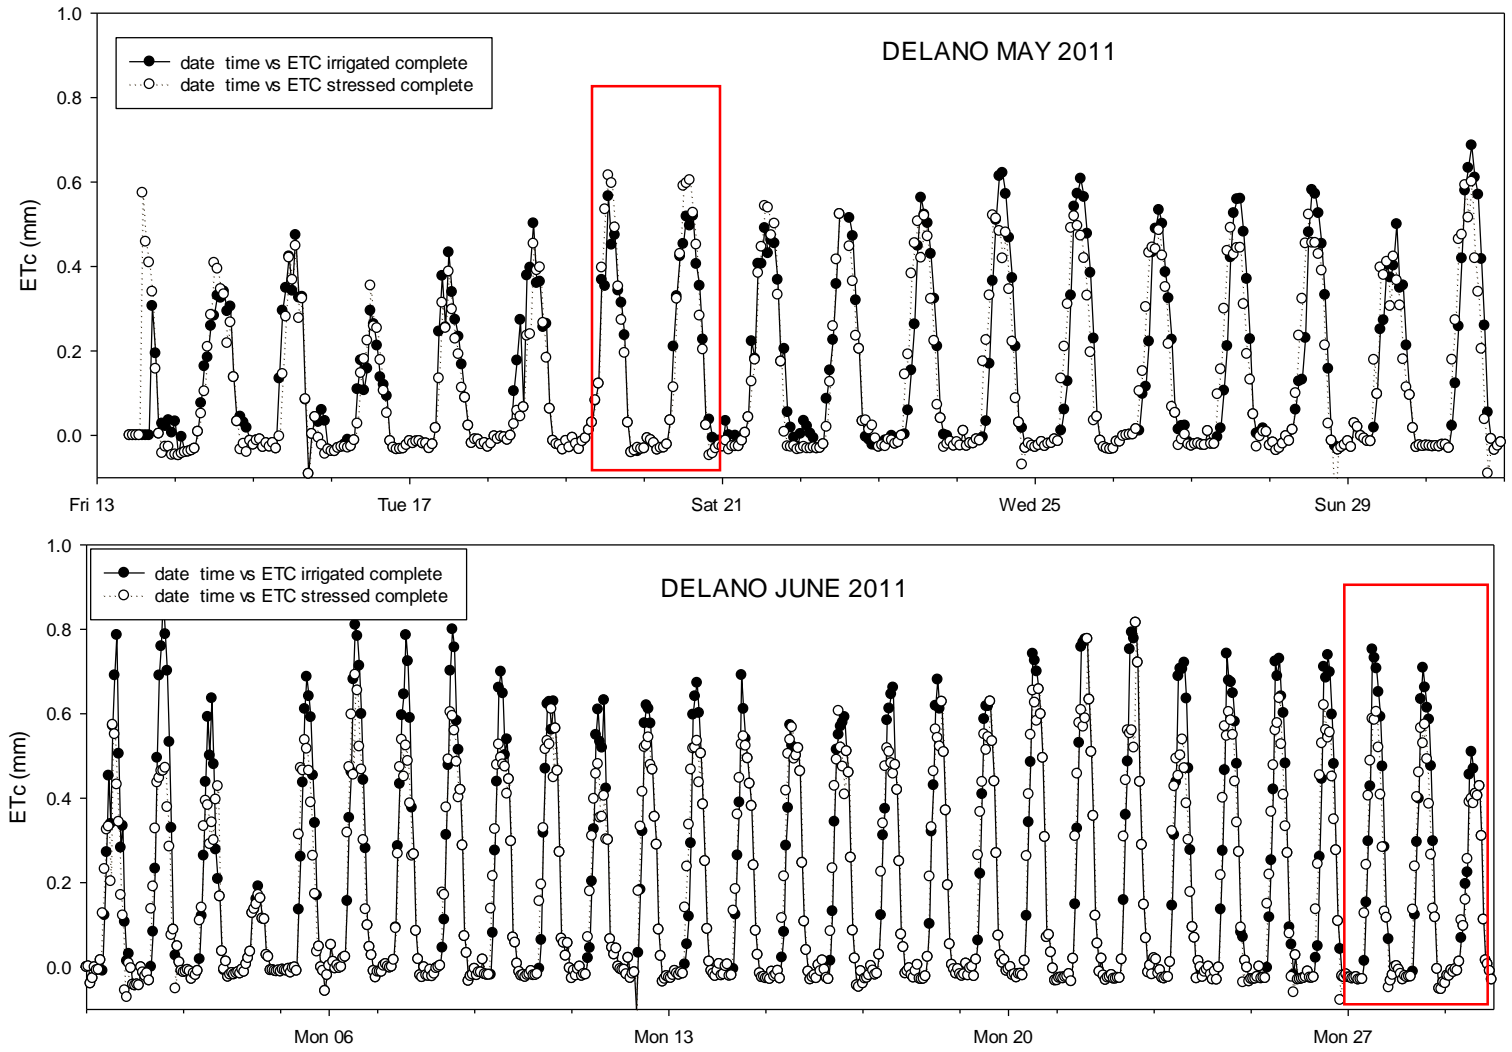

CIMIS weather stations are located throughout California, primarily in agricultural areas. Established in 1982 to improve irrigation efficiency by establishing the maximum ET on a daily basis.

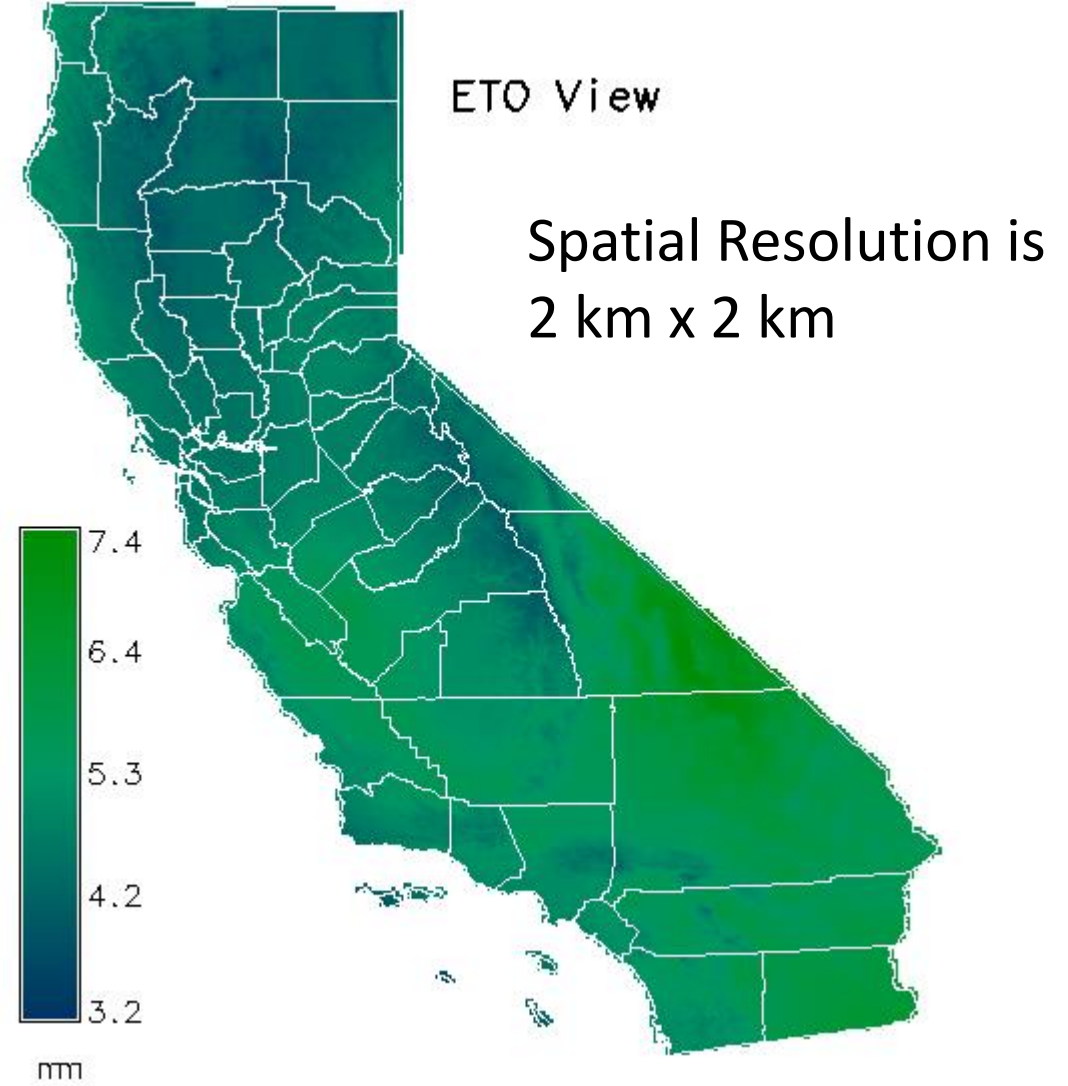

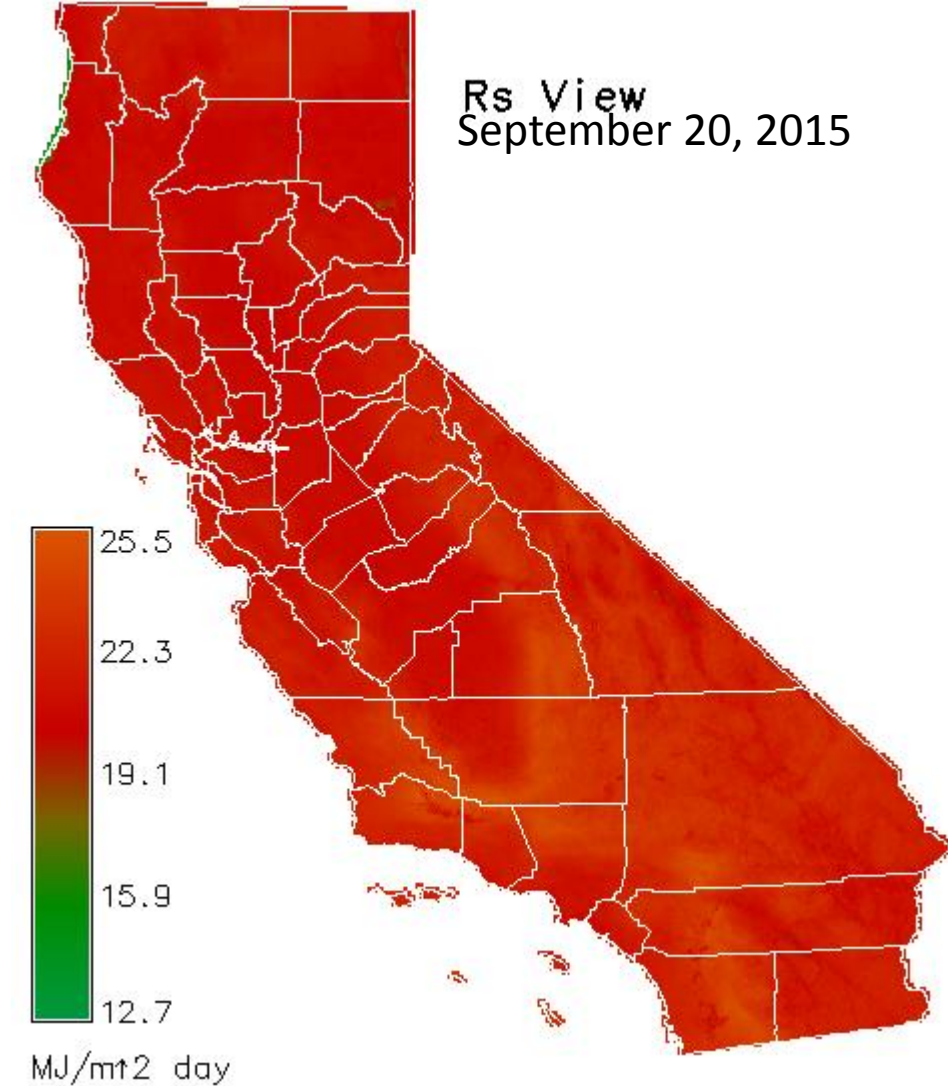

Eddy Correlation Measurements of CO₂ and Water Fluxes

Delano Vineyards 2011: ETC

EC System measures gas concentrations, transport rates, and general weather station data

Spatial CIMIS: Statewide Daily Estimates of Potential ET₀

What remote sensing platform is best for agriculture?

Satellites

Manned aircraft

UAS

Spatial Resolution: 1.5m to 30m

1m to 5m typical

10cm to 1m or more

Spatial Extent: State-wide, regional

multiple farm to regional

subfarm to regional

Spectral Resolution: Multispectral, Vis, NIR, TIR
Lidar

Multispectral 3 or 4 band VNIR
Hyperspectral, Thermal IR & Lidar

Multispectral 3 or 4 band VNIR
Hyperspectral, Thermal IR &

Temporal Resolution: On-schedule, Weekly

On-demand, generally irregular

On-demand, generally irregular

Temporal Resolution:

There are many UAS platforms from very small to suborbital, with a wide range of payload capacities and endurances

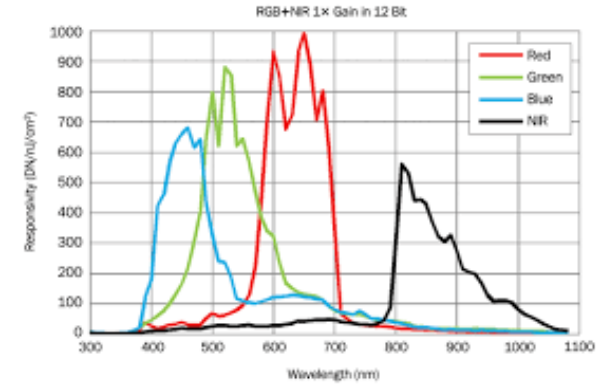

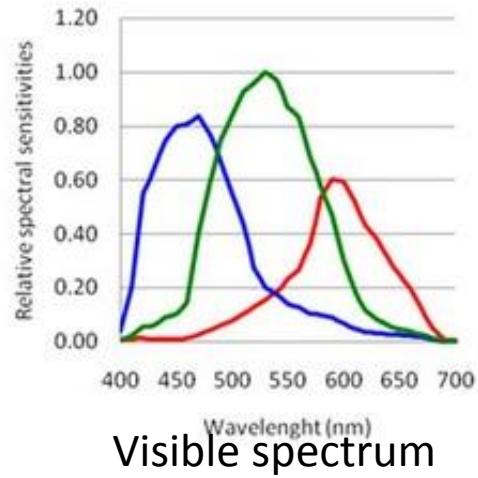

UAS FOR CALIFORNIA WATER RESOURCES SUMMIT

What measurements are needed from UAS to manage water?

What type of sensor do you need? Visible Bands and Color Infrared

Digital camera
Blue, green, red visible bands

Multispectral imager
4-6 bands, visible and near-infrared (NIR)

Images from Minnesota Geospatial Information Office

Most UAS use simple visible or color infrared digital cameras

RGB camera

Interpretations are based on spatial patterns

Plants have high reflectance in the NIR,
Which makes them red in Color Infrared imagery

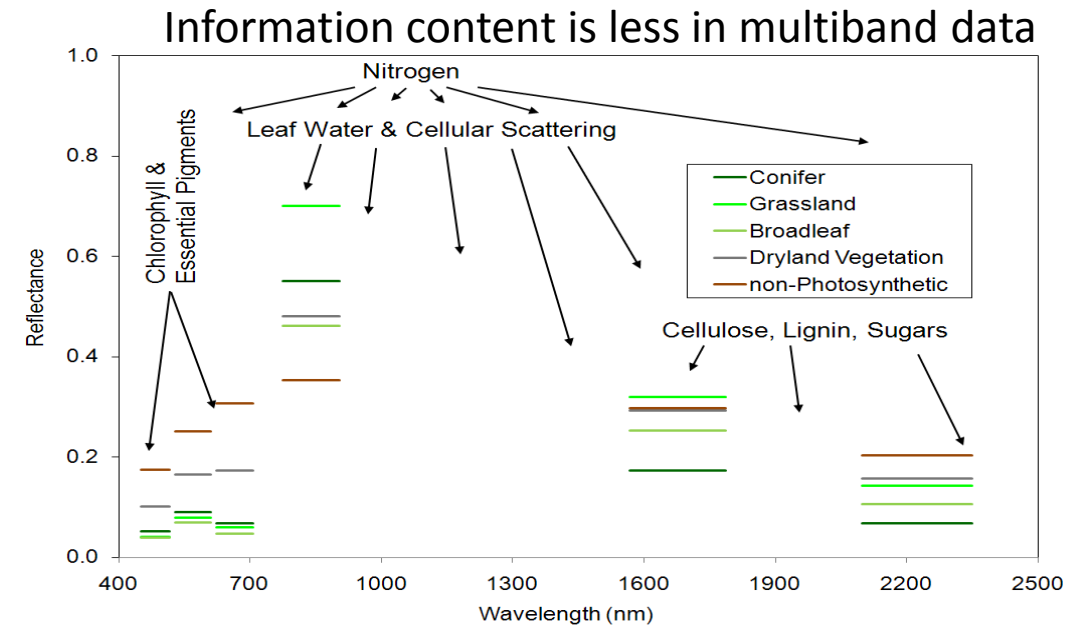

What type of sensor do you need?

Hyperspectral Imager

Hyperspectral imager
100s of bands, visible through reflected solar infrared (to 2500nm)

Fields are distinguished by different combinations of canopy chemistry and foliar density
Spatial patterns relate to crop types in different fields

Irrigation applications

Plant water status

What kind of data do you need? Thermal Imagery

Thermal cameras:
Most are
1 band
but
multiband
is
available

True Color Visible Bands

Pass 1 (11:47) Air Temp: 306K
06/29/2011

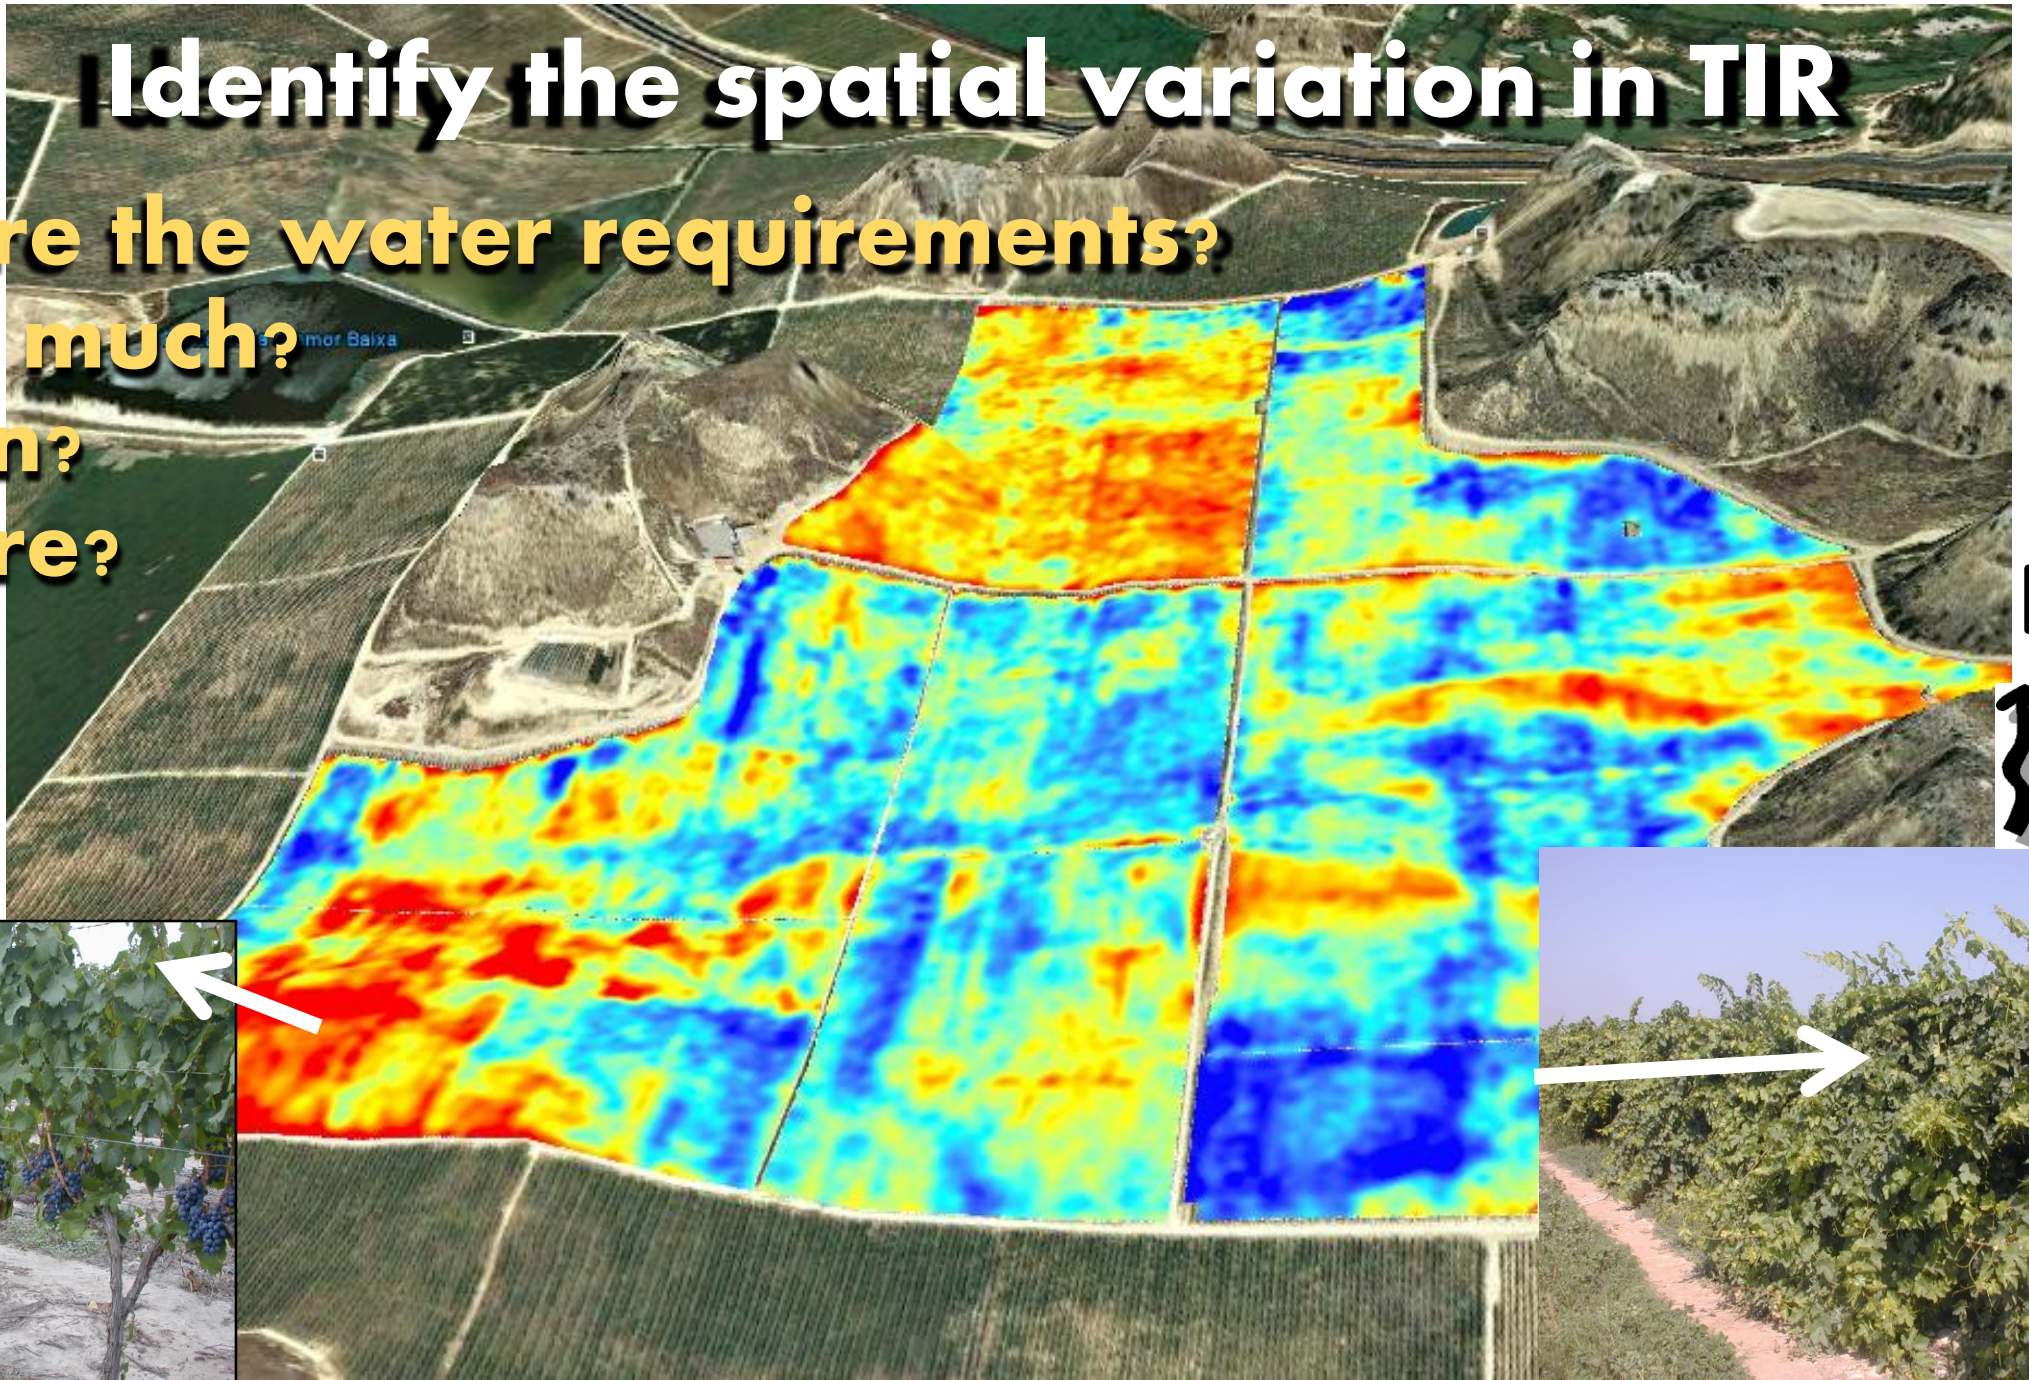

Pass 2 (14:03) Air Temp: 308.5K

Identify the spatial variation in TIR

What are the water requirements?

- **How much?**
- **When?**
- **Where?**

Crop temperature is closely related to canopy temperature

Water Content

High

Low

Thermal Band temperature

Increasing Canopy/Surface Water Content

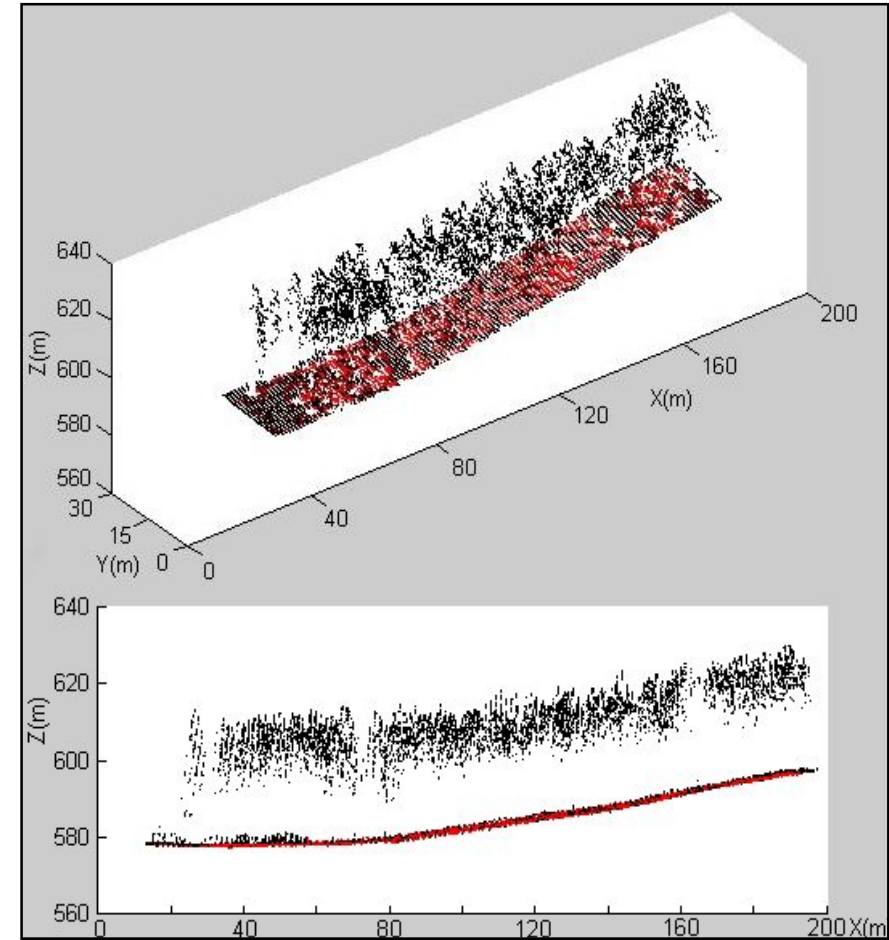

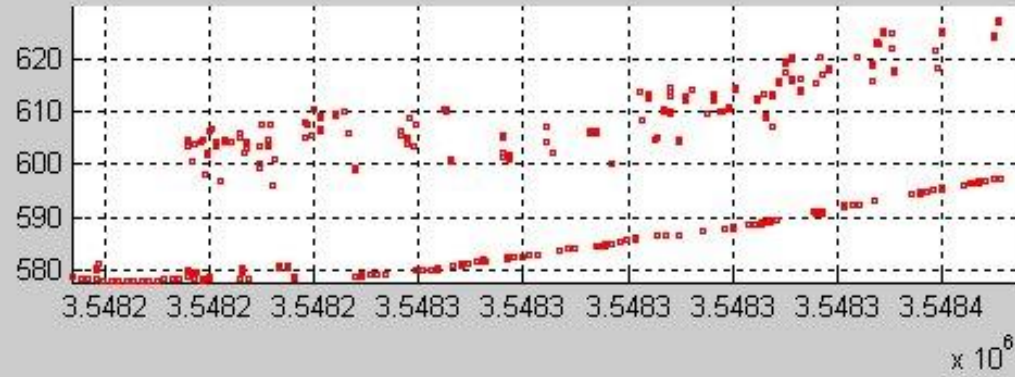

87°F

159°F

Increasing temperature

Lidar Scanning provides topographic information and canopy structure

Riaño et al., 2004

Optech Orion H300 LiDAR system
